

How do computers count numbers?

Imagine that you can only count with the digits 1 and 0, how would you be able to add, subtract or do anything else that you normally do with numbers whose digits go from 1 to 10?

A computer can only store a 0 or a 1 but it can store lots of them. E.g. the number 123 is stored as 1111011 on the computer. We call these **binary** numbers.

Activity 1

Look at the table below. Can you figure out what the next number in the Binary number column is? How about the rest?

Decimal number	Binary number
0	0
1	1
2	10
3	11
4	100
5	101
6	110
7	
8	
9	
10	
11	
12	
13	
14	
15	
16	

Activity 2

We know how to add decimal numbers, e.g. $10+7=17$, we can also add binary numbers e.g.

$$1+1=10 \text{ (this not ten!!)}$$

If we look at our table we see 11 in binary corresponds to 3 in decimal.

You can add $11+11$ like this:

(remember 1)

$$\begin{array}{r} + 11 \\ 11 \\ \hline \end{array}$$

$$11$$

$$110$$

Try adding the following, some are already filled in.

Decimal number	Binary number
$0+1=1$	$0+1=1$
$1+1=2$	$1+1=10$
$1+2=3$	$1+10=$
$1+3=4$	$1+11=$
$2+2=4$	
	$10+11=$
	$11+11=$
	$110+11=$
	$101+11=$
	$111+10=$
	$10+101=$

Activity 3

Again we know how to subtract decimal numbers, e.g. $15-5=10$, again we can do the same with binary numbers e.g.

$$11-1=1 \text{ (in binary)}$$

Again try the following, as usual some are already filled in. Some subtractions in decimal haven't been converted to binary, can you help fill them in?

Decimal number	Binary number
$2-1=1$	$10-1=1$
$3-1=2$	$11-1=10$
$3-2=1$	$11-10=1$
	$101-1=$
	$110-10=$
	$111-11=$
	$110-11=$
	$110-11=$
	$111-10=$
$8-3=$	
$9-4=$	
$10-2=$	
$10-3=$	

Activity 4

When you were doing the last activities did you notice any patterns?

Is there anything special about the numbers 2,4,8,16 ?

Decimal number	Binary number
2	10
4	
8	
16	
32	
64	
128	
256	

Activity 5

Try adding the following numbers in binary: $1+2 + 4 + 8 + 16 +32$.

What number is this?

What happens if you add 1 to this: $1+2 + 4 + 8 + 16 +32 + 1 = \dots\dots\dots$

Try this in binary.

What can you say about the result?

Can you predict the results of the following operations:

$$1+2 + 4 + 8 + 16 +32 +64+ 1 =\dots$$

$$1+2 + 4 + 8 + 16 +32 +64+ 128+ 1 =\dots$$

Can you formulate a general rule?

Ternary numbers

Imagine now that you can only count with the digits 2, 1 and 0, how would you be able to add, subtract or do anything else that you normally do with numbers whose digits go from 1 to 10?

In this case we say we work with **ternary** numbers.

Activity 1

Look at the table below. Can you figure out what the next number in the Ternary number column is? How about the rest?

Decimal number	Ternary number
0	0
1	1
2	2
3	10
4	11
5	12
6	20
7	21
8	22
9	100
10	101
11	102
12	110
13	
14	
15	
16	
17	
18	
19	
20	
21	
22	
23	
24	
25	
26	
27	
28	
29	
30	

Activity 2

We know how to add decimal numbers, we can also add ternary numbers e.g.

$$11+20=101 \text{ (in ternary)}$$

How would the operation above look in decimal numbers?

Try adding the following, some are already filled in.

Decimal number	Ternary number
$0+1=1$	$0+1=1$
$1+1=2$	$1+1=2$
$1+2=3$	$1+2=10$
$1+3=4$	$1+10=11$
$2+2=4$	$2+2=11$
	$10+11=$
	$111+12=$
	$102+21=$
	$111+10=$
	$10+101=$
$3+3=$	
$1+6=$	
$1+3+9=$	
$9+9=$	
$1+3+18=$	
$1+6+9=$	
$1+6+18=$	
$1+3+9+27=$	
$27+27=$	
$1+3+9+54=$	
$2+6+18+54=$	
$81=$	

Can you write the following numbers in ternary:

30	
37	
60	
64	

Activity 4

When you were doing the last activities did you notice any patterns?

Decimal number	Ternary number
3	10
9	
27	
81	
273	
	1000000

Activity 5

Try adding the following numbers in ternary: $2+6 + 18 + 54 + 162+546$.

What happens if you add 1 to the number above?

Did you notice a certain pattern?

Could you find a similar pattern when trying to write all numbers using only the digits 1,2,3,4?

Can you find a similar rule for other numbers?

Can you prove it?
